Overview

This report is available at no cost from the National Renewable Energy Laboratory (NREL) at . For optimizing the balance between reducing operations and maintenance (O&M) cost and improving performance of photovoltaic (PV) systems, NLR collects data, models performance and costs, and provides expertise to industry. As PV deployment continues to increase, ongoing O&M of these systems is. After solar energy arrays are installed, they must undergo operations and maintenance (O&M) to function properly and meet energy production targets over the lifecycle of the solar system and extend its life. Conducting regular O&M ensures optimal performance of photovoltaic (PV) systems while. ing solar photovoltaics operations and maintenance. The f rst two webinars in this series can be found bel elements of the maintenance services to a PV plant. It comprises regular visual and physical inspections,as well as verification that all the key comp nents of the solar plant are in good. Advanced operation of a PV plant such as modulating output or power factor can confound the drawing of conclusions from monitored data. A monitoring system should account for clipping of output due to high DC-to-AC ratio, interconnect limits, and called-for curtailment or any other reason. Where. Preventive Maintenance activities are the core element of the maintenance services to a PV plant. It comprises regular visual and physical inspections, as well as verification activities conducted with specific frequencies. It is under the responsibility of the O&M contractor to prepare the task. This report is available at no cost from the National Renewable Energy Laboratory (NREL) at National Renewable Energy Laboratory, Sandia National Laboratory, SunSpec Alliance, and the SunShot National Laboratory Multiyear Partnership (SuNLaMP) PV O&M Best Practices.
