

Compressed air solar container principle water

Overview

As the compressed air fills the bladders, water is pushed out of the container and up an energy gradient to a location that is at a higher potential energy. The stored energy can be accessed by controllably releasing compressed air from one or more bladders. Savannah River National Laboratory (SRNL) has developed a system and method using a hybrid compressed air/water energy storage system. This system can be used in a subsurface land-based system or a submerged water-based system. Energy storage systems that can efficiently store excess off-peak. As the water is sprayed, micron size droplets directly exchange heat with the compressed air while traveling from the top of the vessel to the water level. The heat of compression is transferred to the water. By comparing different possible technologies for energy storage, Compressed Air Energy Storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. [1] The first utility-scale CAES project was in the Huntorf power plant in Elsfleth, Germany. Which energy storage technology has the lowest cost?
