

Donkey skin solar container material

Overview

Ejiao or donkey hide glue, is a gelatinous substance, made from boiling the hides of donkeys, which is used in traditional Chinese medicines and beauty products. It dates back more than 5000 years. Donkey skins are one such animal derivative, the skins are used to produce ejiao, which is a luxury product and believed by some to have a variety of health benefits. The increasing demand for ejiao is putting the global donkey population at risk from skin trade. As the United Nations Environment Program (UNEP) has identified, 75% of all emerging and re-emerging infectious diseases are ones that pass from animals to humans and they do not exclusively emanate from wildlife, domesticated animals and livestock can be carriers too. The entire global process of. They are the quiet laborers that carry clean water and firewood, transport children to school, mothers to clinics, and goods to market. However, donkeys are disappearing and rising in cost due to Chinese demand for their hides. Wiebke Plasse of the German animal welfare group. The lives of millions of donkeys have been put at risk because of rapidly growing demand for 'ejiao', a product made from donkey skins used in traditional Chinese remedies. Working alongside international and local NGOs, SPANA is calling for an immediate halt to the global donkey skin trade. What. But here's the kicker: donkey caravans are currently moving photovoltaic panels to some of the world's most critical solar installations. In Morocco's Atlas Mountains and Kenya's Rift Valley, these four-legged transporters are bridging the gap between modern energy needs and challenging terrain. At least 5.9 million donkeys are slaughtered for their skins every year. The collagen from their skin produces ejiao, a traditional Chinese medicine. China's domestic donkey population has collapsed, so, the ejiao industry has shifted to a global trade network to source its donkey skin to continue.
