## Overview

---

alfanar Ring Main Units (RMUs) are a gas insulated, compact, enclosed, and extendable type of MV Switchgear up to 36 KV. The RMUs are installed in a photovoltaic power plant to control and protect the supplied energy from the photovoltaic transformers. RMU, Ring Main Unit, is a medium voltage switchgear, consisting several electrical components, Load Break Switch, Circuit Breaker, Fuse, Surge Arrester, Instrument Transformer, Protection Relay, etc. In the rapid growth of new energy applications, such as photovoltaic (PV), energy storage (BESS). Ring Main Units, or RMUs for short, play a key role in keeping voltage levels stable across renewable energy networks. When these units keep voltages within safe ranges, they help make sure electricity keeps flowing smoothly into the grid without interruptions. The design allows for better control. Ring Main Units are compact modules that are gas-insulated and sealed, comprising main switching devices and ancillary components to ensure continuous secondary power distribution. The precise arrangement and configuration of components always depend on the particular application and loading. A smart RMU helps to optimize your application for the modern grid, with features to improve power availability and quality, while helping to manage costs and boost efficiency. Improve safety, reliability, connectivity, and efficiency with EcoStruxure™ Grid, our active energy management. Eaton provides turnkey solar solutions for the distribution of generated energy to the grid, tailored to unique customer requirements. In terms of safety, due to the variable and unpredictable power output from solar sources, we're well-equipped to address voltage stability and regulation, issues. Brunstock's step up transformer substations are designed to convert power on solar farms from LV to MV. Our modular pad mounted (metal-clad) substations convert low-voltage AC power generated by the PV inverter into medium-voltage AC power and feed it into the power grid. A Brunstock step up.
