Long-term savings come from peak shaving, self-consumption of solar [pdf] There is a growing recognition that local electricity markets (LEMs) for distributed power resources are. To address this issue, an optimization method for peak-valley time-of-use electricity pricing on the generation side is proposed, taking into account the fluctuation of distributed photovoltaic grid-connected output. This method involves constructing an output model of the photovoltaic power. By setting different peak-valley electricity price spread, the electricity consumption changes in the process of gradually increasing peak-valley electricity price differentials are studied.
